What is claimed is

- 1. A coil spring comprising metal wire and having an inner coil diameter, an outer coil diameter, a coil pitch, a coil circumference, and a coil length along a coil axis, said metal wire having a wire length, a surface, a subsurface layer, and at least one transverse cross-section with two opposing coil binding contact points on said surface, said two opposing coil binding contact points establishing an opposing contact axis, each said transverse cross-section further having a predetermined transverse residual compressive stress magnitude distribution within said wire, and said predetermined transverse residual compressive stress magnitude distribution being substantially symmetrical about said opposing contact axis.
- 2. The coil spring of claim 1 wherein at least one said predetermined transverse residual compressive stress magnitude distribution is additionally substantially symmetrical about a perpendicular bisector of said opposing contact axis, said perpendicular bisector intersecting said opposing contact axis at an origin.
- 3. The coil spring of claim 1 wherein magnitudes of each said predetermined transverse residual compressive stress magnitude distribution increase monotonically along a portion of said opposing contact axis between said origin to said subsurface layer.
- 4. The coil spring of claim 1 wherein at least one said predetermined transverse residual compressive stress magnitude distribution extends along said wire length for a distance greater than said coil circumference.
- 5. A peening mask for selective peening of the coil spring of claim 1, said mask comprising a cylindrical inner shield and a coiled outer shield, said cylindrical inner shield having a diameter slightly less than said inner coil diameter of the coil spring of claim 1 and a length not less than the coil length of the coil spring of claim 1, and said coiled outer shield having an inner diameter slightly greater than said outer coil diameter

6	of the coil spring of claim 1 and said coiled outer shield having a pitch substantially equal
7	to the coil pitch of the coil spring of claim 1.
1	6. A method for selective peening of a coil spring that comprises metal wire and has
2	an inner coil spring diameter, an outer coil spring diameter, a coil spring pitch, and a coil
3	spring length along a coil spring axis, the method comprising
4	providing a peening mask for selective peening of said coil spring, said peening
5	mask comprising
6	a cylindrical inner shield having a diameter slightly less than said
7	inner coil spring diameter and a length not less than said
8	coil spring length; and
9	a coiled outer shield having an inner diameter slightly greater than
10	said outer coil spring diameter and having a pitch
11	substantially equal to said coil spring pitch; and
12	inserting said cylindrical inner shield within the coil spring to form a first
13	assembly;
14	inserting said first assembly within said coiled outer shield to form a second
15	assembly;
16	aligning said cylindrical inner shield and said coiled outer shield with the coil
17	spring; and
18	peening said second assembly.
1	7. A peening mask for selective peening of a coil spring that comprises metal wire
2	and has an inner coil spring diameter, an outer coil spring diameter, a coil spring pitch,
3	and a coil spring length along a coil spring axis, said peening mask comprising
4	a cylindrical inner shield having a diameter slightly less than said inner coil spring
5	diameter and a length not less than said coil spring length; and
6	a coiled outer shield having an inner diameter slightly greater than said outer coil
7	spring diameter and having a pitch substantially equal to said coil spring
8	pitch.
